The 90-Score Essay Template (Copy + Adapt)

Four paragraphs, 210–250 words total (the official range is 200–300). Copy the frame, then adapt every bracket to the prompt — the structure is reusable, the content must be fresh. Memorised stock sentences are detected and penalised by the AI scorer.

Paragraph 1 — Position (40–50 words): While *[restate the topic's claim]*, I believe that *[your clear position]*, because *[one-line core reason]*.

Paragraph 2 — Argument + Example (70–80 words): The strongest argument for this view is *[argument 1]*. For instance, *[a named country, company, study, or policy]* shows that *[specific outcome]*. As a result, *[cause-effect link back to your position]*.

Paragraph 3 — Counter + Refutation (70–80 words): Admittedly, some argue that *[counterargument]*. However, *[your refutation with a second example or reason]*, which is why this objection does not change the overall picture.

Paragraph 4 — Conclusion (30–40 words): In summary, *[restate position in different words]*. Going forward, *[one implication or recommendation]*.

Worked Sample Answer (204 words)

Topic: Artificial intelligence will replace most human jobs within 20 years. Discuss both views and give your opinion.

While artificial intelligence is transforming many industries, the claim that it will replace most human jobs within two decades overstates its current trajectory. Job displacement is real, but full replacement in the majority of occupations is unlikely given the social and cognitive complexity of human work.

Proponents of this view point to automation's rapid expansion in manufacturing, logistics, and data entry. Amazon's warehouse operations, for instance, have replaced thousands of pickers with robotic systems. The economic incentive to automate repetitive tasks is undeniable, and as AI costs fall, adoption will accelerate across more sectors.

However, roles requiring empathy, ethical judgement, creative problem-solving, and interpersonal communication are far harder to automate. Healthcare, education, social work, and senior leadership all depend on these qualities. More importantly, history shows that technology creates new job categories as it eliminates old ones — the internet era eliminated typing pools but generated millions of digital roles.

In conclusion, AI will significantly reshape the workforce, but wholesale replacement of human employment is implausible in the near term. Governments and individuals should focus on reskilling rather than anticipating obsolescence.
